

Pixel-perfect UIs.
Production-ready web apps.
Already live inside bank apps.

Muhammad Mukarram Asad Full Stack Developer — Frontend Focused

~3 yrs Professional experience, internship through permanent engineering role	Bank-live Personal finance product live with an international bank, plus two Pakistani banks live or in UAT	Real-time Live dashboards, AI-powered features, and Figma-to-React product builds
---	---	---

ABOUT ME / WHY WORK WITH ME

I am the engineer you bring in when the design is approved and the product still has to work for real users. I build and harden frontend-heavy products in React and Next.js — clean components, live data, and interfaces that stay precise under production traffic. I also work in Python when the backend needs a capable pair of hands.

My strongest proof is **Hysab Kytan PFM**, a personal finance layer embedded in bank apps. Customers see live transaction history, spending insights, budgets, and saving goals. I built across accounts, insights, budgets, and saving goals in React and Next.js. I also built the frontend for **Omni Vision**, a real-time computer-vision monitoring dashboard — live alerts, camera scenarios, and operational charts.

Startups get speed. Banks get care. Corporate teams get someone who can join an existing codebase, ship the next slice, and leave it cleaner than they found it.

CORE SERVICES

01 Product UI & Web Development

- Pixel-perfect Figma-to-React / Next.js builds
- Responsive layouts that hold on every screen
- Clean, reusable component systems
- Admin dashboards and data-heavy product screens

Benefit: You launch an interface that looks intentional in the demo — and still looks that way after real users arrive.

02 Production Debugging & Application Care

- Diagnose and fix issues in live apps and websites
- Stabilize regressions without a rewrite
- Maintain and improve existing codebases
- Performance work that users actually feel

Benefit: The product you already have starts working again — faster, calmer, and without throwing away what is already live.

03 Full-Stack Product Engineering

- API integration and disciplined state management
- Real-time features and live data views
- Payment flows and AI-powered product features
- Full-stack MVPs for startups and internal tools

Benefit: One builder from interface to working product — fast enough for a startup, careful enough for a bank.

HOW IT WORKS

1

Scope the work

Share the product, the pain, and the deadline. I come back with a clear plan, a timeline, and what “done” looks like.

2

Build in the open

You review working UI, not slide decks. We iterate on the real product until it feels right.

3

Ship and steady

I help you launch, fix what production surfaces, and leave the codebase in a state your team can own.

CALL TO ACTION

If you have a product to ship, a live app that needs fixing, or an MVP to stand up — let’s talk. Tell me what you are building. I will reply with a clear next step.
